

Article Overview

A distribution box relocation device, often called a consumer unit relocation kit, allows safe and compliant repositioning of electrical fuse boxes or consumer units.

Overview

A distribution box relocation device is designed to simplify the process of moving a consumer unit or fuse box within a home or building. These kits ensure that the relocation is safe, compliant with electrical standards, and convenient, especially during renovations or upgrades . They are suitable for both domestic and light commercial applications.

Components

Typical consumer unit relocation kits include:

- o Mounting brackets for secure installation of the consumer unit
 - o Wiring and connectors, often including DIN-rail terminals with lever or push-in mechanisms for easy connection
 - o Enclosures to house the consumer unit safely, protecting it from dust, moisture, and accidental contact
 - o Safety features such as insulated terminals and pre-configured wiring paths to reduce installation errors
- Some kits, like the 818 Consumer Unit Relocation Kit, come with specific WAGO connectors and a compact enclosure (dimensions 215x200x95mm), making them suitable for standard domestic installations .

Benefits

- o Compliance: Ensures adherence to electrical safety standards.
- o Ease of installation: Pre-configured components reduce the complexity of relocation.
- o Flexibility: Can be used in various locations within a building, including walls or utility rooms.
