

How to shut off the power to the fire protection distribution box

Preview

Securing power at this location is simple and safe: Turn off the breakers starting at the bottom and work your way to the top, finishing with the main breaker controlling the utility. Locating and shutting off the electric service to a structure is typically done very early in a fire event. Doing so helps reduce the risk of firefighters encountering stray currents and being electrocuted. In most cases, firefighters are able to quickly find a master circuit breaker and isolate. Fire protection system emergency shutdown procedures are critical components of comprehensive fire safety protocols that can mean the difference between minor property damage and catastrophic loss. Start by documenting your building's specific protocols. This exterior disconnect cuts off the utility's power supply before it enters the dwelling. The primary outdoor shutoff device is located near the electric meter, but. How does your department disconnect the power at structure fires? Does your first arriving officer/engine knock the meter off or switch the power off during their 360? Or do you call for the power company to have them do it? Just curious how other departments handle this threat.

Knowing the location and procedure for this external shutdown protects first responders and occupants from electrocution hazards.

Incident commanders usually try to do this as soon as reasonably

Fire departments must establish preplanned emergency responses with local utility companies and train firefighters to

The intention is to allow firemen to quickly shut off the power before entering the house. Some residences and all

Some residences and all mobile homes already have an outside service disconnect. But many have the service panel
