Each port may be attached to the boards or network/line cards via a SFP module which must be a OLT module for it to have its Tx and Rx wavelengths swapped, but not all OLTs use SFP modules as shown in the image to the left. Overview An optical line termination (OLT), also called an optical line terminal, is a device which serves as the service provider endpoint of a. It provides two main functions: 1. to. OLTs include the following features: o A downstream frame processing means for receiving and churning an cell to generate a downstream frame, and converting a parallel dat. Most vendors integrate an entire fiber optic management system for ISPs to manage OLTs as well as client ONTs and as such are not interoperable. o o BT-PON.
