

# What is the Guardian Wireless Module

## Preview

The Guardian wireless modem provides a high-speed data link suitable for a wide variety of applications requiring system security and diagnostic reporting. Designed for speed and efficiency, Guardian provides over-the-air data rates up to 19. Sensor data is uploaded to a cloud-based software platform that leverages machine learning to measure tri-axial vibration and surface temperature. Learn more about Nozomi Guardian Air, the first wireless security. Guardian Air is a wireless security sensor for operational technology (OT) and Internet of Things (IoT) environments. The MT3620 is the first Azure Sphere certified "microcontroller", a completely new class of connected SoC IoT device that features "end-to-end security". User applications can target its 500 MHz ARM Cortex-A7 core as well as two general purpose 200 MHz.

Nozomi extends its offering with Guardian Air, a security sensor designed to help organizations detect wireless threats

Guardian is also selectable for analog operation: paging, phone line substitution, slow speed data applications, 600 ohm or high
